

$H(2,3)$, the Baker–Kegel knot K_1 (census o9_30634), as the closure of the 4-braid $X_2^3 T_2$ with $X_2 = \sigma_2\sigma_1\sigma_3\sigma_2$ and $T_2 = \sigma_1^{-1}\sigma_2\sigma_1\sigma_1\sigma_2$. Changing the 6 circled crossings gives the unknot: all of copy 2, which then cancels copy 1; the last crossing of copy 3; and the σ_2 of T_2. Since $g = g_4 = 6$ (slice–Bennequin), $u = 6$.
